

Track 1: **Operations & Customer Support**

Post building the N8N workflow this will significantly enable operations and support teams to focus on resolving customer queries and increase the efficiency in which customer queries are responded to

Ticket Categories:

In this system, customer support requests are categorized into four main types: **Payment Issues, Delivery Issues, Technical Issues, and Account Issues.**

These categories are selected by the customer directly in the Google Form, which ensures that every ticket is structured and easy to process.

Having predefined categories eliminates ambiguity and ensures that each request can be routed automatically without manual review.

Routing Rules

The automation workflow uses n8n to read each new support request from Google Sheets.

A Switch node checks the **Issue Category field**, and maps it based on the issue selected, the ticket is routed to the appropriate team:

- ◀ Payment Issues → Payments Team
- ◀ Delivery Issues → Logistics Team
- ◀ Technical Issues → Tech Support
- ◀ Account Issues → Account Support

How automation improves response times

Previously, all tickets were stored in a single spreadsheet and had to be manually reviewed and assigned. This created delays and increased the risk of human error and oversight.

With automation:

- Tickets are routed instantly to the relevant teams when submitted
- No manual sorting is required

- Customers receive immediate acknowledgement emails which gives them confidence their query would get a resolution soon

This significantly reduces response time, improves accuracy in ticket assignment, and allows support teams to focus on resolving issues instead of spending time sorting and manually assigning tickets to each team. This would save time in terms of efficiency and also increase the accuracy of providing the most accurate solution to the customer queries.
