

Problem Statement

Modern professionals constantly switch between tools to:

- Manage tasks
- Send emails
- Schedule meetings
- Look up important information

This leads to:

- Context switching
- Lost productivity
- Delayed actions

Goal

Build a Telegram-based AI Assistant that:

- Understands user queries
- Answers questions using a knowledge base (RAG)
- Performs real-world actions using integrations (MCP)

Approach

1. Build a marketing knowledge base covering: brand voice and tone, visual identity guidelines, target audience personas, product launch campaign strategy, influencer outreach strategy, content calendar rules launch dates, and email marketing best practices
2. Go to pinecone and create your marketing assistant index and provide the required attributes
3. Build your first workflow on n8n using the form trigger
4. Connect the pinecone node on n8n and connect that node to embedding open AI, this configuration should be the same as the pinecone setup in step 2
5. Then add the Default data loader and recursive character split, with chunk split to 500 and chunk overlap to 50 as it cannot read the whole document at once

6. After this workflow create a new workflow on N8n for your telegram BOT

01. Connect a telegram bot (Send message as a trigger)

02. Connect respective AI agent and LLM model (Here we use Open AI as we used the same in the first workflow)

03. Very important to give a specific system message prompt, reason is we are asking the agent to perform an action and answer a question, we should ensure the prompt is specific to this or else the workflow will not work

Below is the system prompt, you can ask Chat GPT or any LLM to help generate this Prompt

04. Ensure for good user experience you provide instructions in case the MCP does not work what message to throw back to Telegram bot

Hi 12:20 AM ✓✓

Hi! How can I help you today? (I can answer questions about brand/campaign guidelines or help with tasks like sending emails, creating tasks, or scheduling events.)

System Message

If the user asks a QUESTION → use Pinecone.

If the user asks to DO something (send email, create post, schedule meeting) → use MCP tool

You MUST use the Pinecone tool to answer EVERY question.
Do NOT answer from your own knowledge.

If you do not use the tool, your response is invalid.

Always call the tool first using this format:

```
{  
  "query": "user question"  
}
```

Only after receiving results from the tool, generate the final answer.

1. ANSWERING QUESTIONS — use the Pinecone knowledge base tool to look up brand guidelines, campaign strategies, tone of voice, influencer outreach rules, and content calendar guidelines.
Always base your answers on the knowledge base.

If the user asks to perform an action (send, create, schedule) → use MCP tool

EMAIL:

If the user asks to send an email:

- Generate recipient, subject, and message
- Use a default email like influencer@example.com if not provided

- Then use MCP to send the email immediately

TASK:

If the user asks to create a task OR describes an action like:

- publish a post
- post on LinkedIn
- upload content
- share a post

Treat it as a TASK.

- Generate a clear task title (example: "Publish LinkedIn post")
- Then use MCP to create the task

CALENDAR:

If the user asks to schedule a meeting/event:

- Extract title, date, and time from the user input
- Use them directly
- Then use MCP to create the event
- Generate title, date, and time
- Then use MCP to create the event

MCP FAILURE HANDLING:

If MCP fails:

Respond with:

"Failed to complete the action. Please try again."

IMPORTANT:

Do not ask for confirmation.

Do not ask follow-up questions.

Always execute the action using MCP.

}

Only after receiving results from the tool, generate the final answer.

1. ANSWERING QUESTIONS — use the Pinecone knowledge base tool to look up brand guidelines, campaign strategies, tone of voice,

influencer outreach rules, and content calendar guidelines.
Always base your answers on the knowledge base.

If the user asks to perform an action (send, create, schedule) → use MCP tool

EMAIL:

If the user asks to send an email:

- Generate recipient, subject, and message
- Use a default email like influencer@example.com if not provided
- Then use MCP to send the email immediately

TASK:

If the user asks to create a task:

- Generate a task title
- Then use MCP to create the task

CALENDAR:

If the user asks to schedule a meeting/event:

- Generate title, date, and time
- Then use MCP to create the event

IMPORTANT:

Do not ask for confirmation.

Do not ask follow-up questions.

Always execute the action using MCP.

05. Under AI agent under tools connect your pinecone vector and give a description to use this tool to answer any questions about the marketing campaign, tone and to use this knowledge base first
06. Then under the 2nd tool node connect your MCP client node
07. Lastly connect telegram node to the AI agent basically asking it to reply to you after the execution of the workflow based on the chat message sent

MCP Workflow

Under step 5 mentioned above we need to connect our end point API to the MCP client node and for this we need to create an MCP workflow

1. Open a new workflow on N8N, and insert MCP server trigger. Copy the URL from the nod parameter and paste in the the above workflow>MCP Client>Endpoint. This will connect this node to MCP trigger

- As per the problem statement then insert 3 nodes under the MCP trigger i.e Send an email, Create a calendar invite and create a task. These 3 nodes refer to the action the bot will need to take if asked to

Use Cases.

1. Open telegram and create a BOT
2. Post BOT creation you can ask the BOT to “ suggest a tone the campaign launch should be”.
Run workflow 2 and pinecone vector should light up which means the agent is looking up the pinecone index and answering the question
3. A response should come back to the telegram bot after referring to the knowledge base
4. In case you need the BOT to perform an action like send an email,create a post or create calendar event ask the BOT for example “Create a post now”

Based on the brand knowledge base, use a confident, benefit-focused, urgency-driven tone.

Why: the guidance recommends this blend for product launches (it drives conversions and aligns with launch KPIs like conversion rate and CAC), and it fits the typical pre-launch → launch → post-launch flow (build anticipation, convert at launch, then retarget).

Examples you can reuse:

- Email subject: Meet Product — more value, less wait. Limited-time launch offer.
- Hero headline: Unlock faster results — intro pricing ends soon.
- Social caption: Early access now open. Get key benefit — spots are limited.

If you want, I can draft copy for specific channels in this tone.

This message was sent automatically with

5. In case you want the workflow to perform an action you can ask the bot to say send an email to an influencer, when you run workflow 2 now the MCP client node should light up because you want it to perform an action

You should get a response from the BOT as below

Based on the email ID configured in the MCP workflow 3 you should see an email in the inbox
